

More exercises:

Starting with the following HTML

```
<html>

  <head>
    <title>See the World - Travel</title>
  </head>

  <body>

    <div class="banner">
      
      <p>Chinese Culture in action!</p>
    </div>
    <div class="left-story">
      <h1>See more of the world</h1>
      <p>
        You can see the world and experience so much
with a background in computer programming
      </p>
    </div>
    <div class="right-story">
      <h1>Work anywhere</h1>
      <p>
        Have a career that allows you to work at home
and all over the world!
      </p>
    </div>

  </body>

</html>
```

We need you to try and create two version of the website.

1/ The first is a site - the banner needs to be across the top of the page and the two stories need to be side-by-side.

We need the h1 headings to be Helvetica font size 1.5em. we need the text for banner paragraph to have a black background - and try and overlay it on the image.

Save this in jsfiddle.net - do your best and we can review.

2/ The second version is that we want the image to be on the left, then we need to look to put the two stories to the right of it.

3/ Your own look - have a go at ways you can put the page together - remember that you can use any colors, fonts, sizes and layouts.

I want you to experiment with tags such as

margin-top, margin-left, margin-right, margin-bottom
float
background

Remember the key is to make sure you use google to learn more - try as much as you can - never give up.

Learning to program is as much about learning to learn as it is learning to do it. When you feel stuck either drop us an e-mail or go back to google and look for more information on CSS.

You can do it!
